English for Cabin Crew (Schlecht erlernt) (Audio Terence Gerighty. 1. Terence Gerighty (2011) English for Cabin Crew (Schlecht erlernt). at Amazon.com Category:2011 albumsThe following relates to the signal processing arts, audio arts, speech processing arts, and related arts. More particularly, the following relates to techniques for improving audio quality of a sound field in a listener's ear canals. There are many conventional systems for generating a three-dimensional (3D) sound field to a listener, including those which use binaural sound recording and playback. In general, such 3D sound fields are generated by reproducing sound recorded in a 2D space or generating the sound of an object in 3D from a position of an object in space. For example, in conventional 3D sound systems employing binaural sound recording and playback, left and right stereophonic signals representing a desired sound are generated from an object or sound source and are reproduced to the left and right ears of a listener via speakers. The listener can thus perceive as if the object or sound source were in front of him or her and the sound from the object or source was being reflected from the surfaces of the object or source. Similarly, when generating a 3D sound field from data representing an object or sound source in 3D from a viewpoint, the sound of the object or source in 3D can be synthesized from the position of the object or source in 3D from a position of the listener. However, conventional methods for generating and/or reproducing a 3D sound field suffer from various drawbacks. In particular, for a user sitting in a conventional theater or listening to conventional stereophonic recording and/or playback of 3D sound, conventional 3D sound fields can lack fidelity and realism. For example, the listener can experience one or more of the following with conventional 3D sound fields: loss of reverberation and other spatial qualities which are perceived as important to a true 3D sound field; sounds which are spatially skewed in a manner that is not natural; the timbre or other characteristics of a sound from a particular location may be different from that of the sound elsewhere in the sound field or simply the same sound from different angles/positions; and/or sounds that appear to be from different sources (e.g., "choppy" or "dry"). In some cases, the spatial qualities of conventional 3 f678ea9f9e
